LOG STORE

If you are burning wood it really should be dry, 25% is the maximum water content for efficient wood burning.

This log store has been designed to encourage nature to naturally dry freshly sawn timber as quickly as possible. Dependent upon type of wood, diameter and length, split or not split, this process can take anywhere between six and twenty-four months.

Dry wood is a must for any type of wood burning. You must either buy pre-dried timber and keep it dry, or season your own. The log store has been designed in a modular fashion, therefore facilitating both types of approach. One log store holds 1.5m³ of logs, if you are buying pre-dried timber this may be adequate for your needs. However, if you are naturally seasoning larger quantities just join two or more together side by side or back to back.

Remember burning dry wood will give you efficient cost effective heating.

Width: 1240mm, Height to Eaves: 1670mm, Height to Ridge: 1820mm, Width of Ridge: 1310mm, Depth 820mm.
